FULL-STACK DESIGN AND IMPLEMENTATION OF THE MINIHOTEL MANAGEMENT SYSTEM

MiniHotel

Information Systems / Web Development

This project details the design and implementation of MiniHotel, a web information system for managing small and medium-sized accommodation facilities. It creates a centralized solution that digitizes key operational processes, from reservations to seasonal rates. The backend was developed using Python, Flask, SQLAlchemy, and an SQLite database. The user interface was built with Next.js, React, and TypeScript. The resulting full-stack application features modules for guest registration, interactive calendar reservation management and monitoring. This system streamlines administrative tasks, eliminates manual errors, and provides management with valuable occupancy and revenue data through analytical reports.

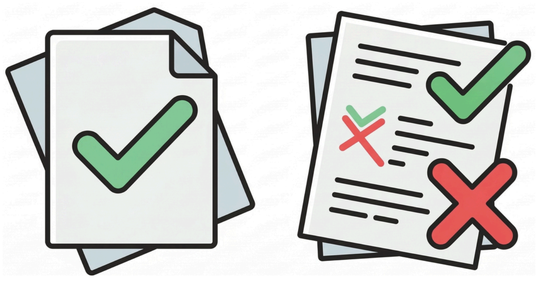
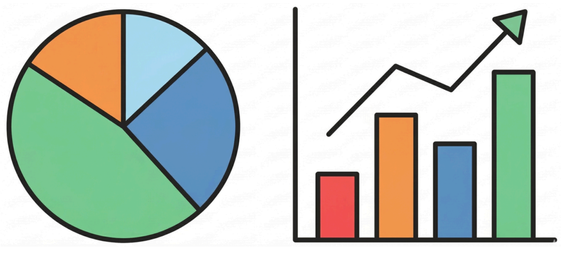
What makes MiniHotel great

EFFICIENCY
Saves time & money



ACCURACY
Fewer Mistakes



INSIGHTS
Data-driven decisions

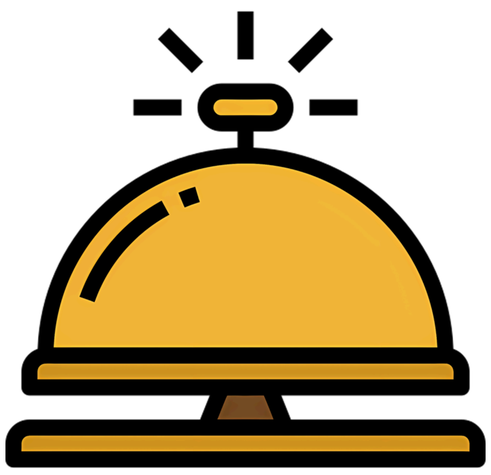
The Urgent Truth

About 60% of small hotels in Czechia still use Excel or paper.

This includes most of the 4,200+ local pensions.

Key Features

- Guest Registration Form
- Reservation Calendar
- Housekeeping Status
- Seasonal Rates



How It Works
